

A guide to management of extravasation reactions occurring during administration of IV iron

	Initial when complete
STOP the infusion immediately and disconnect the drip, do not remove the cannula	
Inform medical staff immediately	
Aspirate the extravasated drug by connecting a clean syringe to the cannula and drawing back	
Mark the extravasation area with a pen and remove the cannula	
Elevate the limb (if possible)	
Cool the area for 24-48 hours and closely monitor the skin and underlying tissues for changes.	
Consider referral to plastic surgery team	
Clearly document the management plan in the patient's medical records	
Complete a clinical incident form
